P11. Write a program to get two numbers from a user and take the first one to the power of the second one, and print out the result:

Example:

```
========================================================
a: 8

b: 2

a^b = 64

========================================================
```

A **bold** font indicates what a user might type in. An *italic* is what the program reflects from what a user typed in.

Hint: 2**4 = 16.
