

P1. Write a program to calculate a power (in watt) from voltage on and current through the device: ask a user for a voltage across its terminal and a current flowing through it. Then, calculate power,  $p = v*i$  and print out the result.

Example:

```
=====  
Enter voltage (V): 5  
Enter current (A): 0.02  
The power is 0.1 W  
=====
```
