P6. Based on P5, write a program to ask a user for an investment in rice production (baht/rai), an average rice production (kg/rai) and the wholesale price (baht/kwian), calculate the balance sheet, and report it.

Example:

```
=====================================================================
Investment (baht/rai): 4500

Rice production (kg/rai): 800

Wholesale price (baht/kwian): 16400

Balance = income (13,120.00) – investment (4,500.00) = 8,620.00 baht/rai

=====================================================================
```

*Hint: income (baht/rai) = rice product (kg/rai) * (1 kw/1000 kg) * price (baht/kwian)*

Use `P6_template.py`. (The template is only to allow smooth autograding.)
