

PS. Write a function named `vowel_count` to take a text and count the number of vowel alphabets (a, e, i, o, u) in the text, and return the number as an integer. For example, “Alibaba” has 4 vowel alphabets.

Hint: See searching example at the beginning. Also, `str.lower()` or `str.upper()` may be handy

Example

When invoke by

```
r = vowel_count('Kruntep Mahanakorn Amornrattanakosin')
print(r)
```

it results

```
=====
13
=====
```
